

I am a licensed amatuer radio operator AA9U and have concerns that the rules in Part 15 do not go far enough in protecting licensed radio service from harmfull interference. My antennae are within 50 feet of overhead power lines. I also operate mobile and currently have interference issues with cable television and expect BPL transmissions will increase this dramatically. Please reflect carefully on how interference issues will be mediated. It seems that power companies react slowly to resolve current interference issues on components they are familiar with. How can we expect them to remediate issues in which they have little to no experiance? Thank you for your consideration.
